

Test Plan – Terminal Project

1. Introduction

This test plan aims to define the activities required to verify the correct functioning of the Terminal website. This application was developed to allow users to consult terminal information, check associated companies, types of vehicles they operate, available services, view schedules, get travel quotes, and purchase tickets online.

The presented test plan will cover the validation of the main system modules, navigation between pages, form functionality, and the ticket quotation and purchase flow.

2. Test Items

The modules and components to be tested are:

- Home page
- Companies module
- Vehicles module
- Services module
- Contact module
- Quotations module
- Tickets module

3. Features to be Tested

The functionalities to be tested are:

- Display of general terminal information
- Consultation of associated companies
- Consultation of vehicle types
- Consultation of offered services
- Consultation of available schedules
- Data entry in forms
- Calculation of quotations considering origin, destination, travel date, return date (optional), number of passengers, and selected service type
- Search for available trips
- Selection of a trip for purchase
- Entry of passenger information

- Display of purchase summary
- Navigation between system pages
- Adaptation to different devices such as computers, phones, and tablets

4. Features Not to be Tested

The following features are out of scope for this test plan:

- Real-time database connection
- Advanced server security
- Load or stress testing
- Integration with payment gateways
- API testing
- External integrations not implemented in the project

5. Test Approach

The main approach of this test plan will be manual, using the following techniques:

- **Black box testing:** validating system inputs and outputs without analyzing the internal code
- **Functional testing:** verifying that each module behaves as expected
- **Form validation testing:** checking required fields, incorrect data, and field validations
- **Navigation testing:** ensuring links, buttons, and redirections work correctly
- **UI testing:** verifying that visual elements are displayed properly
- **Responsive testing:** ensuring the website works correctly on all devices (computers, phones, tablets)
- **Compatibility testing:** verifying behavior across different browsers (Chrome, Mozilla, Microsoft Edge)

6. Pass/Fail Criteria

A test will be considered **passed** when:

- The obtained result matches the expected result
- No issues affect the normal user flow
- The interface is displayed correctly
- The executed functionality works properly

A test will be considered **failed** when:

- The evaluated functionality does not meet the expected result
- Validation, navigation, or display errors occur
- The system prevents completing key processes such as quoting or purchasing a ticket
- Issues are found that affect the user experience

7. Suspension and Resumption Criteria

Testing may be **suspended** under the following conditions:

- The application does not load correctly
- Critical errors prevent continuation of the main flow
- Broken links or pages block navigation
- The testing environment presents technical issues

Testing may be resumed when:

- The detected error has been fixed
- The application becomes available again
- The main modules load correctly
- The necessary testing environment conditions are restored

8. Test Deliverables

The deliverables of this test plan include:

- Test plan document
- Test case list
- Test execution records
- Test evidence (e.g., screenshots)
- Defect/incident report
- Final test results

9. Schedule

The proposed schedule for testing activities is:

- Week 1: Application analysis and scope definition
- Week 2: Test plan design
- Week 3: Test case creation
- Week 4: Functional and validation testing
- Week 5: Navigation, UI, and compatibility testing
- Week 6: Incident reporting and adjustments

- Week 7: Results consolidation and final delivery

10. Resources and Responsibilities

Human Resources

- **Student/Tester:** responsible for designing, executing, and documenting tests
- **Instructor/Tutor:** responsible for reviewing and validating the test plan

Technological Resources

- Web browsers: Chrome, Mozilla, Microsoft Edge
- Internet connection
- GitHub repository
- Desktop or laptop computer, phone, and tablet
- Screenshot tools
- Microsoft Word for documenting results

11. Risks and Contingencies

Potential Risks

- Page loading failures
- Forms with incomplete validations
- Errors in the quotation or purchase flow
- Display issues on mobile devices
- Differences in behavior between browsers
- Broken links or incorrect navigation

Contingencies

- Record the detected error with evidence
- Repeat the test after correction
- Test on another browser or device
- Adjust the execution plan if critical failures occur
- Prioritize validation of the main system modules

12. Approval

Name: Liseth Dayana Monroy Briñez

Date: March 25, 2026
